

Requests

From a hospital's call to blood out the door, tracked end to end

OVERVIEW

The Requests screen manages every incoming blood request — from a hospital or a patient — through its full lifecycle: submitted, approved, and fulfilled (or rejected), with urgency clearly visible the whole way.

KEY CAPABILITIES

- Log a new request with patient name, hospital, blood group, units needed, and urgency level (Normal / High / Critical)
- Approve or reject incoming requests
- One-click "Fulfill" that automatically deducts the right amount of stock — using the oldest-expiring batches first — and updates inventory instantly
- Built-in safety check: if there isn't enough stock, fulfillment is blocked with a clear message instead of silently failing
- Search and filter by patient, hospital, or status

HOW YOUR TEAM USES IT

Coordinators use this to triage incoming needs — a Critical request stands out immediately next to a Normal one. When stock is available, "Fulfill" collapses what used to be a manual process (checking a paper or spreadsheet inventory, doing the math, then updating records by hand) into a single click, and it's impossible to accidentally promise blood that isn't actually in stock.
